DETAILED ACTION

Election/Restrictions

1. Applicant's election of Group I of claims 1-26, and species of category (a) optical film of claim 17, category (b) binder of claim 6, and category (c) support of claim 19 in the reply filed on 11/7/2005 and 8/18/2005 is acknowledged. In summary, the commonly elected species from categories (a)-(c) are claims 17-19. Claims 1-16 and 20-45 are withdrawn from further consideration. In particular, it should be noted that since claim 1 does not require a transparent polymeric support, as set forth in claim 17, claim 1 and its dependent claims are structurally distinct and independent from the film species of claim 17. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (MPEP § 818.03(a)).

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

3. Claims 17-19 are rejected under 35 U.S.C. 102(a) as being anticipated by Saitou et al. (US 2003/0180520).

Saitou's invention is directed to a transparent anti-glare hard coat film formed on at least one surface of a transparent polymer film, the transparent hard coat layer is composed of inorganic micro-particles uniformly dispersed in an ionizing radiation curable organic binder, and the inorganic micro-particles having a mean particle diameter of 1-10 μm . The organic-inorganic hybrid hard-coat agent preferably contains reactive silica (abstract and paragraph 0008). Examples of the inorganic particles include porous silica, etc. (paragraph 0031). Suitable transparent polymer film include triacetyl cellulose film, etc. (paragraph 0015). Finally, it should be noted that the specific surface area of a particle is inherently proportional to its diameter, and silica is inherently an inorganic polymer.

Claims lack novelty.
